Security Whitepaper

1. Encryption

All data is encrypted in transit with TLS 1.2 or higher. Data at rest is encrypted with AES-256. Customer-managed keys (CMK) are available on the Enterprise plan only.

2. Access control

Access is governed by role-based access control. All employee access to production requires hardware-backed multi-factor authentication and is logged. Production access is reviewed quarterly.

3. Compliance

Nimbus Cloud holds SOC 2 Type II and ISO 27001 certifications. HIPAA workloads are supported only under a signed BAA on the Enterprise plan. We are not currently PCI DSS certified and customers must not send card numbers to the API.

4. Vulnerability disclosure

Report vulnerabilities to the security team through the disclosure portal. We acknowledge reports within 2 business days and aim to remediate critical issues within 7 days.

5. Data deletion

On workspace deletion all customer data is purged from primary storage within 30 days and from backups within 90 days.
